PREPARATION:

GENERAL

1) Shape and dress surface in accordance with specifications. All vegetation must be removed. Enkamat works best when laid after proper compaction techniques.
2) The surface must be smooth and free of ruts and rocks.

SLOPE INSTALLATION

1) Adjacent strips are installed snugly with 2"-3" overlap and pinned at 3'-5' intervals. Install Enkamat peaked side down.
2) Pin Enkamat into 12" deep trenches around the entire perimeter and cover with soil.
3) Distribute seed

STORM WATER MANAGEMENT POND

"AS-BUILT" ELEVATIONS AS OF NOV. 19, 1984
BY: KENNETH A. McCORD P.E.# 1974

-SPECIFICATIONS-

GENERAL

1. For construction specifications not covered herein, the contractor shall refer to the "Soil Conservation Service of Maryland Construction Specifications for Ponds, Code 378", pages 378-14 through 378-19 dated July 1981.

EARTH DAM-EMBANKMENT

1. Suitable material from the pond excavation may be used for the embankment.
2. Suitable material shall be placed in 8" loose layers and compacted to 95% of Standard Proctor ASTM T-99.
3. Moisture content of the suitable material shall be within the range of 3% below optimum moisture to 3% above optimum moisture.
4. Area under the embankment shall be cleared and grubbed to remove all trees, vegetation, roots or other objectionable material and topsoil stripped.
5. The fill material shall be free from roots, stumps, wood, rubbish, oversize stones, frozen earth or other objectionable materials. The fill height all along the length of the embankment shall be increased by 10%.
6. Fill materials shall be placed in 8" maximum thickness (before compaction) layers which are to be continuous over the entire length of the fill. The most porous material shall be placed in the downstream portions of the embankment. Backfill for the Cutoff Trench and the upstream side of the Dam shall be the most impervious material available."
7. Compaction shall be by multiple wheel pneumation tired roller, vibratory roller or other types of acceptable rollers. Rolling of each layer shall be continuous over its entire area and the roller shall make sufficient coverages to insure that the required density has been obtained.

60" BCCMP

1. Backfill around B.C.C.M.P. pipe shall be placed in horizontal layers not to exceed 4 inches in thickness and compacted by hand tampers or other compaction equipment. At no time during the back filling operation, shall construction equipment be allowed to operate closer than 4 feet to any part of the B.C.C.M.P. pipe. Under no circumstances shall the contractor drive equipment over any part of the B.C.C.M.P. pipe unless there is a compacted fill to a depth of 24 inches or greater over the B.C.C.M.P. pipe.
2. The B.C.C.M.P. pipe shall be firmly and uniformly bedded throughout its entire length. Where rock or other unsuitable soil is encountered under the pipe, all such material shall be removed and replaced with suitable earth compacted to provide adequate support.

PERMANENT SEEDING

ALL DISTURBED AREAS SHALL BE STABILIZED AS FOLLOWS:

1. SEEDED PREPARATION: Loosen upper 3 inches of soil by raking, discing or other acceptable means before seeding.
2. SOIL AMENDMENTS: Apply 2 tons per acre dolomitic limestone (92 lbs. /1,000 sq. ft.) and 600 lbs. per acre 0-20 fertilizer (14 lbs/1,000 sq.ft.). Harrow or disc lime and fertilizer into upper three inches of soil. At time of seeding, apply 400 lbs. per acre (9.2 lbs./1,000 sq.ft.) of 38-0-0 ureaform fertilizer and 500 lbs. per acre (11.5 lbs./1,000 sq.ft.) of 10-20-20 fertilizer.
3. SEEDING: For the periods March 1 thru April 30, and August 1 thru October 15, seed with 45 lbs. per acre (1.4 lbs./1,000 sq.ft.) of Kentucky 31 Tall Fescue. For the period May 1 thru July 31, seed with 40 lbs. Kentucky 31 Tall Fescue per acre and 2 lbs. per acre (.05 lbs./1,000 sq.ft.) of weeping lovegrass. During the period of October 16 thru February 28, protect site by: Option (1)-2 tons per acre of well anchored straw mulch and seed as soon as possible in the spring. Option (2)-use sod. Option (3)-seed with 60 lbs./acre Kentucky 31 Tall Fescue and mulch with 2 tons/acre well anchored straw.
4. EROSION CONTROL FABRIC: "Hold Gro", Gulf State Paper Corporation, P.O.B. No.3199 Tuscaloosa, Alabama, 35404, or an approved equal. Install as recommended by the Manufacturer.
5. MAINTENANCE: Inspect all seeded areas and make needed repairs, replacements, and reseedings.
6. Add Crown Vetch lequminous seed to mixture on 2:1 slopes. Seed mixture shall be sown at the rate of 45 pound/acre with Crown Vetch sown at 15 pound/acre. Inoculant for Crown Vetch shall be at the rate of 6.7 oz. powder or liquid culture per 20 pounds Crown Vetch. Seed inoculated with liquid culture shall be sown within 24 hours after treatment; seed inoculated with powdered culture shall be sown within 48 hours after treatment. The seeding contractor may elect to apply the inoculated lequme seed dry and in a separate operation prior to applying an aqueous mixture, or he may apply them in the aqueous mixture with the seed and commercial fertilizer using four times the quantity of inoculum recommended for dry leguminous seed application.
